

Questions:

Explain the difference between the == operator and the === operator:

The == operator compares two objects' values, converting their types if necessary, while the === operator compares the values of two objects as they are.

Explain what a closure is. (Note that JavaScript programs use closures very often):

A function that processes a value that it gets from another function.

Explain what higher order functions are:

A function that calls one or more other functions.

Explain what a query selector is and give an example line of JavaScript that uses a query selector:

It looks for elements that match the provided input and returns the first one.
